

I came to FASEB Meeting on Matricellular Proteins 2013 as a young scientist (postdoctoral researcher) and I definitely enjoy this scientific experience!

I was first honored to be invited to give a talk and share my work with all these experts of the field. I really appreciated this valuable opportunity, which certainly emanated from a wish to promote the new generation of motivated scientists (which I belong to). This conference enabled interesting discussions on common issues we all seem to encounter, thereby strongly contributing to the progression of research in Matricellular Proteins.

Even though, as probably all young scientists have experienced, I might have felt a little bit intimidated by the presence of great specialists of the scientific area, the nice atmosphere of this conference allowed me to rapidly feel comfortable. Indeed, senior researchers showed amazing conviviality and openmindedness towards junior scientists and this friendly environment appeared conducive to interesting and useful interactions in terms of science and/or career development.

In a word, while promoting young researchers, this high-quality and convivial conference offered an auspicious environment for scientific and professional discussions.
